

Design Guidelines (DaisyUI)

Design Architectural Boundaries

- **DaisyUI (The Visuals):** Provides the look and feel. We use its semantic component utility classes (`card` , `btn` , `stat` , `badge`) directly inside our layout shells and Tool UI renderers for instant branding without component file boilerplate.
 - **assistant-ui (The AI Engine):** Manages the core chat state machinery, token streaming handlers, auto-scrolling viewports, and thread session histories out of the box.
 - **Tool UI (The AI Translator):** Intercepts structured JSON payloads returned from LLM function calls, validates them via Zod schemas, and routes them straight into inline UI components.
-

2. DaisyUI Theme Configuration

```
/* theme.css */
@import "tailwindcss";
@plugin "daisyui";

@theme {
  /* Global Layout Constrains */
  --max-width-dashboard: 1440px;
  --max-width-form: 640px;
  --max-width-modal: 480px;

  /* Standard Base Spacing Overrides (If needed, or rely on Tailwind defaults)
  --spacing-app-inline: 1.5rem;
  @media (min-width: 768px) {
    --spacing-app-inline: 2.5rem;
  }
}

@utility container {
  margin-inline: auto;
  max-width: var(--max-width-dashboard);
  padding-inline: 1rem;

  @variant md {
```

```
padding-inline: 2rem;
}
@variant xl {
padding-inline: 3rem;
}
}

@plugin "daisyui/theme" {
default: true;
prefersdark: false;
color-scheme: light;

/* Primary – placeholder dark green */
--color-primary: oklch(30% 0.05 155);
--color-primary-content: oklch(98% 0.01 155);

/* Secondary – placeholder gold/orange from the gradient mark */
--color-secondary: oklch(72% 0.15 65);
--color-secondary-content: oklch(20% 0.02 65);

/* Accent – a lighter tint of the gold for highlights/CTAs */
--color-accent: oklch(80% 0.13 70);
--color-accent-content: oklch(20% 0.02 70);

/* Neutral – dark tone for text/borders, derived from primary green, ac
--color-neutral: oklch(25% 0.03 155);
--color-neutral-content: oklch(95% 0.01 155);

/* Base surface colors – page/card backgrounds */
--color-base-100: oklch(100% 0 0);
--color-base-200: oklch(97% 0 0);
--color-base-300: oklch(93% 0 0);
--color-base-content: oklch(20% 0.02 155);

/* Semantic status colors – standard, not brand-specific, keep readable
--color-info: oklch(70% 0.12 220);
--color-info-content: oklch(20% 0.02 220);
--color-success: oklch(65% 0.15 145);
--color-success-content: oklch(15% 0.02 145);
--color-warning: oklch(80% 0.15 85);
--color-warning-content: oklch(20% 0.02 85);
--color-error: oklch(60% 0.18 25);
--color-error-content: oklch(97% 0.01 25);
```

```

/* Shape tokens — apply everywhere, this is what makes spacing/radius c
--radius-selector: 0.5rem;    /* checkboxes, radios, toggles */
--radius-field: 0.5rem;      /* inputs, buttons, selects */
--radius-box: 1rem;          /* cards, modals, alerts */

--size-selector: 0.25rem;    /* base unit for selector-family sizing */
--size-field: 0.25rem;      /* base unit for field-family sizing */

--border: 1px;               /* default border width across all compone
--depth: 1;                  /* shadow/elevation intensity, 0-1 */
--noise: 0;                  /* texture overlay, keep 0 for a clean bar
}

```

Why OKLCH: DaisyUI v5's native format — perceptually uniform, so lightening/darkening a token (e.g., generating a hover state) stays visually consistent, which matters when one wrong shade breaks the "exact match" goal across dozens of components.

- The Main Page Wrapper: Using `<div className="container">` will now instantly auto-center your application shell at `1440px` max-width and dynamically switch out responsive padding rules at mobile, tablet, and desktop viewports.
- Forms or Content Columns: Instead of hardcoding arbitrary width styles in pages, you can write `<div className="max-w-form w-full">` to enforce exactly `640px` structures across your banking platform workflows.
- AI Chat Modals or Sidebars: Use `max-w-modal` to keep your floating assistant drawer or chat tool container elements locked precisely at a uniform `480px`.

3. Typography

- **English font:** Inter
 - **Arabic font:** Tajawal
 - **Numerals:** rendered in the English font even inside Arabic text blocks — set explicitly via CSS (`font-variant-numeric` / a wrapping span with the English font family) so numerals don't silently inherit the Arabic font's digit glyphs.
-

4. Component Usage Guidelines (mapped to DaisyUI classes)

- **Primary actions** (submit, continue, upload): `btn btn-primary` — uses the dark green, should be the only high-emphasis color per screen.
- **Secondary/tertiary actions**: `btn btn-secondary` or `btn btn-ghost` — gold reserved for accents/highlights, not competing with primary green for attention.
- **Cards** (plan summary, document list items): `card bg-base-100` with `rounded-box` — consistent radius via the `--radius-box` token, never a one-off `rounded-lg` hardcoded in a component.
- **Status indicators** (upload processing, parsed/error): use semantic classes (`badge-success` , `badge-error` , `badge-warning`) rather than brand colors — status meaning should never be conveyed by brand green/gold, to avoid ambiguity.
- **Forms**: `input` , `select` , `textarea` with `--radius-field` — consistent field styling across questionnaire, upload, and chat input.
- **Never hardcode a hex value in component code.** Every color reference goes through a DaisyUI semantic class or CSS variable — this is the actual mechanism that guarantees "everywhere is the exact same match," and it's the rule most likely to get broken under time pressure if not stated explicitly.
